Making deployments
more efficient

Netscale 120 Project Packaging Service

Making deployments more efficient

Preparation for installation of the products you buy can come at high cost and postpone the go-live. Our Project Packaging Service helps you to reduce time and costs to deliver the projects more efficiently.

At first, specify the panel configurations according to the data center needs. R&M then assembles complete panels with modules or cassettes according to your configurations. The Netscale 120 panels will be delivered pre-assembled and packed accordingly, reducing the carton volume by 67% compared to the individual delivery of products.

On site, unpacking goes in no time at all. This work step is reduced by 84% compared to conventional work preparation. The project progresses faster, and labor costs are reduced.

We know that increasing work efficiency has positive effects on your business results.

This is why the Project Packaging Service is designed to:

- Decrease your time to market
- Improve your labor efficiencies
- Reduce your costs
- Reduce your packaging waste

Receive your delivery on which the content of the package and its installation location can be easily identified without having to open the package.

Receive all material in a box, already unwrapped and pre-configured, to increase productivity. Eliminate technicians' time spent on site confirming the position of modules and installing them.

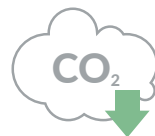

For a more efficient deployment of your data center network infrastructure
